What is the difference between `.size()` and `.length` ? Is `.size()` only for arraylists and `.length` only for arrays?

An individual process in an OS might only be allowed to reserve up to 4GB RAM or less, which means `size_t` would only need to be 32-bit while pointers are 64-bit. 32-bit wide `size_t` wouldn't necessarily

If the size of the int is that important one can use `int16_t`, `int32_t` and `int64_t` (need the `iostream` include for that if I remember correctly). What's nice about this that `int64_t` should not have issues on a 32bit

In this real-life case study, it is proved that a 48V solar power system with a medium-sized hybrid inverter and LiFePO4 storage like HBOWA batteries

I found two ways to determine how many elements are in a variable I always get the same values for `len ()` and `size ()`. Is there a difference? Could `size ()` have come with an imported
